

mbDrawdownDefender V2.0

Quick Start Guide

The full manual is included in the package. · Rule set 2026-08 · onelinalgo.com

Up and running in four steps

- 1 In NinjaTrader: Tools → Import → NinjaScript Add-On..., pick the ZIP file. Then close NinjaTrader completely and restart it.
- 2 Open a chart → Indicators → double-click mbDrawdownDefender.
- 3 Open the Chart Trader on the chart and select your account. Without one you only get DEMO mode.
- 4 Under "1. Select Prop Firm Size" pick your account type – everything else fills itself in.

The four numbers that matter

- 1 Kill-Line – the account value at which your account is finished. The hard line.
- 1 Buffer Left – what is left until then. Always the TIGHTEST of three limits: drawdown, the firm's daily loss limit and your own personal stop.
- 1 Used – how much of it you already consumed. At 30 % the panel turns amber.
- 1 Max contracts @ 20t stop – HOW MANY CONTRACTS YOU MAY TAKE RIGHT NOW. Checked against all four limits at once: Kill-Line, daily loss limit, your personal stop and your firm's contract limit, commission included. A 0 means: do not take this trade.

The number refers to the stop distance you set under "Planned Stop (ticks)" – 20 by default. Enter your own usual stop there and it matches your style. Do not confuse it with the line "Contracts: 0 / 7", which only shows how many contracts your prop firm allows at all.

The colours

- 1 Green: within your limits, trade your plan.
- 1 Amber: warning threshold consumed – reduce your size.
- 1 Red: a limit is breached – stop. A stop screen covers the chart until you click it away.

Three settings worth changing right away

- 1 Personal Daily Stop – your own daily limit, hit BEFORE the firm's. Default \$500.
- 1 Planned Stop (ticks) – your usual stop distance, 20 by default. It drives the "Max contracts" line. Set it to 0 and that line disappears.
- 1 Show All Accounts – shows every other account on one line, tightest first.

If something looks wrong

- 1 It says DEMO MODE → no account is selected in the Chart Trader.
- 1 No sound → leave both sound fields EMPTY, then the tool uses the sounds from your own NinjaTrader installation.
- 1 Panel too large or too pale → Panel Scale and Panel Opacity under "06. Visuals".
- 1 Daily result looks wrong in the morning → the trading day rolls over at 5:00 PM US Eastern, not at your midnight.

This tool informs – it does not trade and it does not stop you. It never places, modifies or closes orders. Your prop firm's own accounting is always the binding source. Responsibility for every trading decision remains with you.
